# Nudging Businesses to Pay Their Taxes: Does the Timing of Reminder Letters Matter? 

Christian Gillitzer<br>University of Sydney

## Mathias Sinning

ANU Crawford School of Public Policy, RWI, IZA

5 April 2018

## Background

- Tax non-compliance takes the form of both unreported income and unpaid debts to the tax office
- There is comparatively little research on the timely payment of tax debts (Hallsworth, 2014)
- Tax gap estimates for the US show average underpayment of \$39bn in 2008-2010
- The bulk of unpaid debt is owed by individual taxpayers and unincorporated businesses
- In Australia, 30 per cent of small businesses did not pay their tax liabilities on time during the financial year 2016-17 and together owed around 67 per cent of total collectible tax debt

## Aim of the trial

- While some taxpayers are unwilling to pay, many have simply forgotten about their debt
- We study the effect of the timing of reminder letters on the payment behaviour of small businesses
- Target population: businesses with a history of compliant payment behavior
- Cases were randomly allocated to receive a reminder letter about one, two or three weeks after their missed tax debt due date
- A control group did not receive a letter for the seven week duration of the trial

## Model

- Taxpayers trade-off the benefit of paying their tax immediately or waiting until the opportunity cost of payment is lower
- Disadvantages of delay include interest penalties on the outstanding debt and the possibility that the debt is forgotten
- If the debt is forgotten, it remains out of memory until a reminder is received from the tax authority
- Sending reminder letters early alerts taxpayers who have forgotten about their debts
- However, an early reminder letter may also cause taxpayers to believe they will receive frequent reminders, reducing the cost of delay and lowering the likelihood of payment

## The taxpayer's problem

- Paying tax incurs a cost of action, $c_{t}$, plus the cost of the outstanding tax debt, $d$
- $C_{t}$ is assumed to be independently drawn each period from a continuous distribution $F$ with density $f$
- If the taxpayer does not pay today, an interest charge is added and the debt grows to $g d$ dollars next period, where $g>1$
- Taxpayer remember their outstanding debt with probability $\rho$ each period and forget about the debt with probability $(1-\rho)$
- Taxpayers believe that they will receive a reminder letter each period with probability $\widehat{\delta}$, which may differ from the actual probability $\delta$

## The taxpayer's problem

- The perceived value function for a taxpayer who has an unpaid tax debt $d$ in memory is given by

$$
\begin{aligned}
V(d, c, \widehat{\delta}) & =\max \left\{-(d+c), \frac{\rho}{R} \mathbb{E}[V(g d, c, \widehat{\delta})]\right. \\
& \left.+\frac{(1-\rho)}{R} \mathbb{E}[W(g d, c, \widehat{\delta})]\right\}
\end{aligned}
$$

where $R>1$ is the taxpayer's discount rate and

$$
W(d, c, \widehat{\delta})=\widehat{\delta} V(d, c, \widehat{\delta})+(1-\widehat{\delta}) \mathbb{E}[W(g d, c, \widehat{\delta})]
$$

is the perceived value function for a forgotten tax debt

## The taxpayer's problem

- If the debt is in memory, the taxpayer will pay in period $t$ if $c_{t}<\bar{C}$, where $\bar{C}$ equates the value of paying today with the value of waiting:

$$
\bar{c}=-d-\frac{\rho}{R} \mathbb{E}[V(g d, c, \widehat{\delta})]-\frac{(1-\rho)}{R} \mathbb{E}[W(g d, c, \widehat{\delta})]
$$

- If the debt is in memory, the debt is paid with probability $F(\bar{C})$
$\rightarrow$ An increase in the perceived probability of receiving a reminder letter $\widehat{\delta}$ lowers the threshold $\bar{c}$ and reduces the probability of debt payment if it is in memory

## Experimental setup

The effect of a reminder letter on payment behavior

- A tax debt is defined to be active if it is unpaid and in memory
- We say a reminder letter is useful if a debt is unpaid and forgotten
- Probability that a tax debt is paid in period $t$ :

$$
p_{t}=F\left(\bar{c}_{t}\right) \operatorname{Pr}\left(\text { active }_{t}\right)
$$

- A reminder letter sent at time $\tau$ activates forgotten debts, which occurs with probability $\operatorname{Pr}\left(\right.$ useful $\left._{t}\right)$

The effect of a reminder letter on payment behavior

- Sending a reminder letter at time $\tau$ increases the probability of payment by time $T$ by

$$
\operatorname{Pr}\left(\text { useful }_{t}\right) \sum_{j=\tau}^{T} p_{j} \mid \operatorname{Pr}\left(\text { active }_{j}\right)=1
$$

- Sending a reminder letter at time $\tau+1$ increases the probability of payment by time $T$ by

$$
\begin{gathered}
\underbrace{\left[\operatorname{Pr}\left(\text { useful }_{\tau}\right)+(1-\rho)\left(1-F\left(\bar{c}_{\tau}\right)\right) \operatorname{Pr}\left(\text { active }_{\tau}\right)\right]}_{\operatorname{Pr}\left(\text { useful }_{\tau+1}\right)} \\
\times \sum_{j=\tau+1}^{T} p_{j} \mid \operatorname{Pr}\left(\text { active }_{j}\right)=1
\end{gathered}
$$

## Hypothetical Repayment Rates

## Trial design

- The trial was conducted based on the 26 March 2017 due date
- A total of 4,787 unpaid debt cases were quarantined from the usual ATO treatment pathways
- Cases were randomly allocated to receive a reminder letter either 12, 19 or 27 days following the due date (stratified randomization)
- A control group did not receive a letter for the duration of the trial
- About the same number of observations were allocated to each of the four groups

## Actual Repayment Rates (Kaplan-Meier Failure Estimates)

## Comparison of Payment Profiles

## Share of Debt Paid

## Treatment Effects on Payment Made by End of Trial

Treatment 1 Treatment 2 Treatment 3
Panel A: Unconditional linear probability model

| Payment Made by End of Trial | $0.248^{* *}$ | $0.238^{* *}$ | $0.234^{* *}$ |
| :--- | :--- | :--- | :--- |
|  | $(0.017)$ | $(0.017)$ | $(0.017)$ |
|  | $[2,401]$ | $[2,402]$ | $[2,388]$ |

By Initial Debt Level

| $\$ 0-\$ 7,499$ | $0.289^{* *}$ | $0.279^{* *}$ | $0.282^{* *}$ |
| :--- | :---: | :---: | :---: |
|  | $(0.019)$ | $(0.019)$ | $(0.019)$ |
| $\$ 7,500+$ | $[2,034]$ | $[2,033]$ | $[2,025]$ |
|  | 0.025 | 0.015 | -0.028 |
|  | $(0.329)$ | $(0.330)$ | $(0.033)$ |
|  | $[367]$ | $[369]$ | $[363]$ |

Note: Robust standard errors in parentheses. Number of observations in brackets. * $p<0.05$, ${ }^{* *} p<0.01$.

Treatment Effects on Payment Made by End of Trial

|  | $(0.028)$ | $(0.019)$ | $(0.027)$ |
|  | $[260]$ | $[325]$ | $[298]$ |

Note: Robust standard errors in parentheses. Number of observations in brackets. * $p<0.05$, ${ }^{* *} p<0.01$.

Treatment Effects on Amount Paid by End of Trial

|  | Treatment 1 | Treatment 2 | Treatment 3 |
| :--- | :---: | :---: | :---: |
| Panel A: Unconditional linear regression model |  |  |  |
| Amount Paid by End of Trial | 590.94 | 252.64 | 634.77 |
|  | $(762.23)$ | $(530.19)$ | $(587.46)$ |
|  | $[2,401]$ | $[2,402]$ | $[2,388]$ |
| By Initial Debt Level |  |  |  |
| $\$ 0-\$ 7,499$ | $463.81^{* *}$ | $389.48^{* *}$ | $440.74^{* *}$ |
|  | $(70.44)$ | $(79.93)$ | $(81.02)$ |
| $\$ 7,500+$ | $[2,401]$ | $[2,402]$ | $[2,388]$ |
|  | 120.71 | -185.18 | 157.06 |
|  | $(768.00)$ | $(537.66)$ | $(594.92)$ |
|  | $[2,401]$ | $[2,402]$ | $[2,388]$ |

Note: Robust standard errors in parentheses. Number of observations in brackets. * $p<0.05$, ${ }^{* *} p<0.01$.

Treatment Effects on Amount Paid by End of Trial

|  | Treatment 1 | Treatment 2 | Treatment 3 |
| :--- | :---: | :---: | :---: |
| Panel B: Conditional linear regression model |  |  |  |
| Amount Paid by End of Trial | 797.05 | 135.41 | 614.75 |
|  | $(802.71)$ | $(449.77)$ | $(515.95)$ |
|  | $[2,305]$ | $[2,323]$ | $[2,303]$ |
| By Initial Debt Level |  |  |  |
| $\$ 0-\$ 7,499$ | $470.50^{* *}$ | $392.78^{* *}$ | $458.77^{* *}$ |
|  | $(52.67)$ | $(66.56)$ | $(65.16)$ |
| $\$ 7,500+$ | $[2,305]$ | $[2,323]$ | $[2,303]$ |
|  | 320.98 | -305.79 | 120.14 |
|  | $(800.99)$ | $(446.61)$ | $(513.36)$ |
|  | $[2,305]$ | $[2,323]$ | $[2,303]$ |

Note: Robust standard errors in parentheses. Number of observations in brackets. * $p<0.05$, ${ }^{* *} p<0.01$.

## Treatment Effect by Initial Debt Level

Cost Calculations

|  | Total interest <br> penalties by <br> day 52 | Number <br> of letters <br> sent | Cost of letters <br> (at $\$ 1.25$ per <br> letter) | Interest <br> penalties less <br> cost of letters | Share cases <br> paid by day <br> 52 |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Trial group | $\$ 23,742$ | 0 | $\$ 0$ | $\$ 23,742$ | 0.53 |
| No letter | $\$ 23,732$ | 1,054 | $\$ 1,318$ | $\$ 13,214$ | 0.81 |
| Week 1 | $\$ 14,532$ | $\$ 1,158$ | $\$ 15,403$ | 0.80 |  |
| Week 2 | $\$ 16,561$ | 926 | $\$ 960$ | $\$ 17,454$ | 0.80 |
| Week 3 | $\$ 18,414$ | 768 |  |  |  |

## Conclusions

- There is little rigorous evidence on the effect of the timing of reminder letters on tax payment behavior
- We find that reminder letters increase the payment probability by 25 percentage points relative to the control group by the end of the seven week trial period
- Payment probabilities do not differ between treatment groups
- Sending reminder letters early accelerates tax debt collection
- The additional revenue collected relative to debt outstanding is modest
- The only meaningful heterogeneity in payment behavior is related to the level of debt
