

Developing interesting theories through problematization

Jörgen Sandberg, *School of Business, the University of Queensland*

It is increasingly recognized that what makes a theory interesting and influential is that it challenges our assumptions in some significant way. However, established ways for arriving at research questions mean searching for gaps in existing theories rather than challenging their assumptions. This paper proposes problematization as a methodology for identifying and challenging assumptions underlying existing literature and, based on that, formulating research questions that are likely to lead to more influential theories.
