

## Developing relevant theories through practical rationality

Jürgen Sandberg, *School of Business, the University of Queensland*

There is an increasing concern that management theories are not relevant to practice. In the paper we contend that the overall problem is that most management theories are unable to capture the logic of practice because they are developed within the framework of Scientific Rationality. We elaborate

Practical Rationality as an alternative framework and show how it enables development of theories that grasp the logic of practice and, thus, are more relevant to management practice.
